
Userchain: Upgrading The Crypto-Community

USECHAIN; UPGRADING THE CRYPTO-COMMUNITY

INTRODUCTION

The newly found or created crypto-community that is Generally known as the chain system (block-chain), is without controversy one of the best technological improvement we have today and as of this age. However, despite all of the great abilities and functions which can be derived from its use in different sector, there are still some defects in this system that needs to be corrected to make it attain a perfection plane. Some of the defects is the shallow security management, a lack of full decentralization to penetrate into all other systems and so on. Meanwhile, a new version of this block-chain will be seen to spring up if all its defects are cleared. This is the main reason why USECHAIN is formed.

ABOUT THIS PROJECT

This project is an interesting one that is fully equipped and built to conform to the perfect picture people desire from the (block-chain) system. It cut across all the spheres and is equipped with an identifier tool. This is not just another project, its is one which brings out the real virtue and beauty of other project in the general crypto-universe. It seeks to bring out perfection in the entire programs and operations carried out in the crypto-universe.

INSIGHT TO USECHAIN

This system has found deeper application in the new technology and is constantly improving as it is scaling above the limitations and barriers that has reduced the value of all the operations done in other crypto-projects as the case may be. Furthermore, it stands its ground as a shield against all the challenges users are faced with while using the block-chain tech, hence making it more secured and usable. It also encapsulates wide spheres, including the banking sector hence simplifying all transactions and ensuring the safety of all the operations and also thriving in the insurance sector and also in many government establishments. The commencement of the construction of usechain started in the year 2016 with the active involvement of its team and was concluded in the month of june 2018.

Although the website has been completed since last year 2017. This solution project was made possible by the supporters and devoted patners through cooperation and devoted consistency. The major priority of this project is to provide an environment that is free from harm and external influence so as to keep users information and transactions safe. It also Plans to achieve a balance and well coordinated performance of activities in the crypto-community. Using a Randomize PoW, a well established security will be maintained in the system.

OTHER FEATURES OF THIS PROJECT

Considering the fact that users private information shouldn't be disclosed to other entities, this project ensures that these data are highly kept so as to avoid being tapped or leveraged by

hackers or third parties. Also, it fortifies the important information against all kinds of malwares that can corrupt users' data and make them useless. Most times, the crypto-community users are always in need of a private and conducive atmosphere which they don't have access to a lot of times, this system will help to establish privacy in this sense to its users thus giving them the freedom to perform any operation at their own pace and in a secured environment. More to this benefits is that, there would be provision of a safe wallet for users to keep all there financially assets be it fiat or cryptocurrency and the identities of the different users in this ecosystem will be quickly verified without any delay.

Furthermore, a tokenized model will be incorporated into this system to allow the overseeing and control of financial resources. It functions with its unique token called the USECHAIN token abbreviated as UST which will used as a reward system for the platform. However, in order to achieve the set goal, usechain will painstakingly monitor and control the way users' identities are being verified, all the banking systems it affiliates with and all the transactions that proceeds from it hence making them unique.

CONCLUSION

All users will be identified and verified in this system to avoid mixed identities thus making sure individual users account is only accessible by the owners alone. All the important services that are linked to users personal data will be supported and highly secured using this network. More to this, all the necessary wallets for saving funds of different cryptocurrencies will be provided to users to enable them perform transactions with their desired cryptocurrency in the ecosystem.
